# High-Impedance Surface Backed Circular Patch Antenna for Wireless Communications

Akash Kumar Gupta, P. Satish Rama Chowdary, and M. Vamshi Krishna

**Abstract** A multi-band antenna is a very attractive solution for wireless communication applications. A low-profile miniaturized compact circular patch antenna backed with a high-impedance surface antenna is presented in this work. A high-impedance surface-based ground plane is an effective method for suppressing the surface waves and hence improves the performance of a patch antenna. The HIS-based ground plane is designed on Fr-4 substrate with a rectangular patch of dimensions of 10 mm × 10 mm having protrusion at the center of the patch. A circular microstrip patch antenna is designed on Fr-4 substrate, and its performance is compared with metallic ground plane and HIS ground plane. The circular patch antenna backed with HIS ground plane radiates in multiple bands 1.63–1.66, 3.86–4.03, 4.19–5.12 GHz with bandwidths of 3–5% in all bands.

**Keywords** Circular microstrip patch · High-impedance surfaces · Multi-band

## 1 Introduction

Efforts to fulfill the severe needs of new and diversified antenna technologies and communication services necessitate an unrelenting effort in antenna designing. The most used microstrip patch antennas suffer from surface waves. The surface waves in antennas are undesirable because they propagate along the ground plane and do not radiate to free space. There is a decrease in the antenna's directivity, gain, and efficiency [1–12]. Surface waves are excited on microstrip antennas when the

**Abstract** An incompressible viscous MHD hydro nanofluid flow of a upright plate with effect of radiative and viscous dissipation is investigated numerically. The energy equation of radiation heat flux is defined by the Rosseland diffusion approximation. Using with suitable similarity transformations the non-linear PDE's are transformed into a set of ordinary differential equations .The converted ODE's are then solved numerically by Keller Box method which is Finite difference method. The effects of various physical constants are analyzed and discussed in graphical and tabular values. The effects of some physical parameters such as Lewis number, Prandtl number, buoyancy ratio, Thermophoresis, Brownian motion, radiation parameter, Viscous Dissipation and magnetic parameter are examined on the velocity, temperature and concentration nanofluid volume fraction profiles as well as on the reduced Nusselt number and the local Sherwood number.

**Keywords:** Radiation parameter, Viscous Dissipation, Nanofluid, Hydro nanofluid, Keller Box method.

## INTRODUCTION

In connection with enhancing heat transfer rate the base fluid that contains a small size of nanoparticles which is known as nanofluid. Nanofluids are used to enhancing heat transfer rate such as heat exchangers, heat sinks in micro channel, radiator as name few. A new class of heat transfer fluids that contains a base fluid and nanoparticles is nothing but nanofluids was first introduced by Choi [1]. M.M. Rashidi, E. Erfani, Analytical method for solving steady MHD convective and slip flow due to a rotating disk with viscous dissipation and ohmic heating [2]. Buongiorno studied about the convective transport in nanofluids [3]. A survey on natural convection boundary layer flow over a vertical plate along with nanoparticles done by Kuznetsov and Nield [4]. Khan and Pop [5] has invented the nanofluid boundary layer flow over a stretching sheet using differential transform method and Padé approximant for solving MHD flow in a laminar liquid film from a horizontal stretching surface was given by M.M. Rashidi, K. Keimanesh [6]. S.M. Aminossadati, A. Raisi, B. Ghasemi [7] studied the effects of magnetic field on nanofluid forced convection in a

# The FM/FM/1/N Model With Encouraged Or Discouraged Arrivals And Reneging

Vasanta Kumar V<sup>1, a)</sup>, Hanumantha Rao<sup>2, b)</sup>, B V S N Hari Prasad<sup>3, c)</sup>

<sup>b)</sup>Corresponding author: sama.hanumantharao@gmail.com

<sup>c)</sup>bvsnhariprasad@gmail.com

**Abstract.** In this paper, we analyze an M/M/1/N queue with encouraged or discouraged arrivals with a modified reneging policy under fuzzy environment. The arrival rate, service rate, encouraged arrival rate, reverse reneging rate, balking rate, reneging rate are considered as Hexagonal fuzzy numbers. The  $\alpha$ -cut and Zadeh's extension principle is used to transform a fuzzy queue into a family of classical crisp queues. Crisp intervals for some performance measures under steady-state are evaluated and presented

## 1. INTRODUCTION

The characteristic of customer impatience must be considered prominently in the analysis of a queueing model. Thus, the customer impatience must be included in the modelling of a queueing system to make it more realistic. This impatience phenomenon occurs in many real-life problems such as hospital emergencyrooms handling critical patients, inventory systems that store perishable items, telephone switchboard handling calls from customers etc.,

Ammar et al.[11 ], Vasanta Kumar et al. [19], Vasanta Kumar [18], Height [1], Altman and Yechiali [7], Yue et al. [ 10] studied queueing systems with customer impatience under different control policies. Rakesh Kumar and Som [13] introduced the concept of reverse reneging in queueing theory and applied it to a single-server Markovian queueing model with reverse reneging. Som and Seth [15] considered a finite capacity Markovian queueing model with encouraged arrivals. They obtained the performance measures of the system and presented the economic analysis through a cost model. Som and Seth [21] presented the steady-state analysis of a finite capacity M/M/1/N queue considering the encouraged arrivals and reverse reneging They obtained some system performance measures under steady-state. Hanumantha Rao et al. [30] studied an M/M/1/N queueing system with encouraged or discouraged arrivals and modified reneging.

The study of queueing models with fuzzy parameters is more meaningful and useful compared to the classical queues (Crisp queues). With the help of Zadeh's [2 ] extension principle, we transform the fuzzy queue into a family of crisp queues by applying the  $\alpha$ -cut approach. The fuzzy queueing system was first introduced by Li and Lee [3 ], further developed by many authors namely Buckley [4 ], Negi and Lee [5 ], Chen [6,8], Srinivasan [12 ]. Dinagar et al. [14 ] described arithmetic operations on Hexagonal fuzzy
