**Abstract**—Past decades onwards the forest property (sandalwood and teak trees) is victimized within the kind of exporting. The objective of this paper is to prevent the exporting of forest property unauthorized and protect the nature. For the implementation of this system PIR sensor, FSR sensor and Flex sensors network is required. These sensors are used to detect the signal where the unauthorized cuttings are takes place and this detected signal information carries through wireless communication to the concerned forest authorities to take preventive action.

**Keywords**—PIR sensor, FSR sensor, Flex sensor, wireless communication.

## I. INTRODUCTION

From couple of decades onwards by observing in newspapers regarding to smuggling of trees in the forests. But what are the causes behind this smuggling, the main cause is trees are mostly useful in the medical sciences as well as cosmetics. Based on this usage vast quantity of currency is concerned in deal of such tree woods. So unofficially cutting of these trees and exporting to other countries. For example, in India, forest authority declared prices of 12000 to 13000 per kilogram for Santalum album but same trees are in international market demanded a high worth. The Indian Santalum album has become high worth in recent years, based on this an Indian government is trying to limit the exportation of sandalwood. Even though the government taking more actions on cutting of trees, but these situations are occurred in frequently and related articles are showed in newspapers. These kinds of things are happening not only in India but also in China, Australia and African countries for various trees [1].

The problem what ascertained is there's no system or any medium to observe the felonious work related to cutting of trees. A mean by that, at your geographic point, you'll understand what happening in forest. Such type of system can accommodate you to provide information with a warning signal by that authority will be able to take necessary actions.

## II. PROPOSED SYSTEM

The proposed system mainly having sensor network at transmitting section and the information which is related to

the sensors are transmitted through wireless communication using Xbee to the receiver section. The below fig 1 gives the general idea of proposed system

Fig. 1. Block diagram of proposed system.

### A. Transmitting Section

The proposed system is mainly established with three types of sensors such as force sensitive resistor (FSR), passive infrared (PIR) and flex sensors at transmitting end. These three sensors are arranged on different places of same tree or on nearest tree. Among three sensors two sensors are giving the output in the form of resistance variation but this variation is not accepted by the Arduino. So the signal conditioner is required to convert the resistance variation into voltage and sends it to Arduino. The Arduino converts these values into digital values which are used in writing conditions for the program. In this way, easily customize the requirements of this paper. The transmitting section of the module is exhibited in the fig 2.

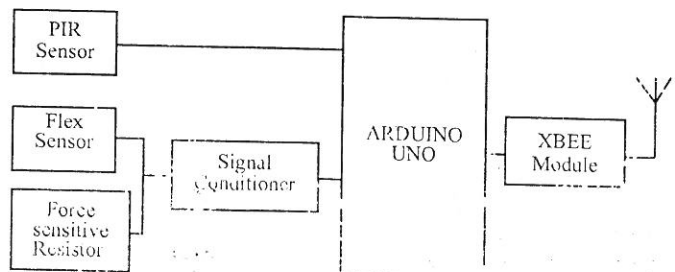

Fig 2. Transmitting section
